

Tiled Code Generator

Tiling is an important program transformation that is used to improve data locality and parallelization granularity. We provide a tiled code generator that produces tiled code with wavefront parallelization supported for the shared memory machine.

Usage

Let's use the classic matrix multiplication as an illustration example, whose alphabets code is the following:

```
affine matrix_product {P, Q, R|P>0 && Q>0 && R>0}
  given  float A {i,k| 0<=i<P && 0<=k<Q};
         float B {k,j| 0<=k<Q && 0<=j<R};
  returns float C {i,j,k| 0<=i<P && 0<=j<R && k==Q};
using
  float temp_C {i,j,k|0<=i<P && 0<=j<R && 0<=k<=Q};
through
  temp_C[i,j,k] = case
    { |k>0 } : temp_C[i,j,k-1] + A[i,k-1]*B[k-1,j];
    { |k==0 } : 0;
  esac;
  C      = temp_C;
.
```
