AlexNet : The Start of a Revolution

Convolutional Neural Nets

- Convolutional layers
 - Local, translation insensitive layers
 - Small number of re-used weights
- Pooling layers
 - Similar to image pyramid
 - No weights at all
- ReLu transfer function
 - Non-linear
 - Avoids vanishing derivatives

Colorado State University

AlexNet Performance (2012)

- Results reported for ILSVRCV 2010
 - A test set based on ImageNet
 - 1000 image classes (random = 99.9% error rate)
- Results reported for Top-1 & Top-5
 - Output activation orders responses
 - Top-1 : best response only
 - Top-5 : is correct answer among top 5 responses?
- Error rates
 - Top-1 : 37.5% (62.5% correct)
 - Top-5 : 17% (83% answers within top 5)

Colorado State University

What Does AlexNet Learn?

- Layer #1 Convolution masks:

Colorado State University

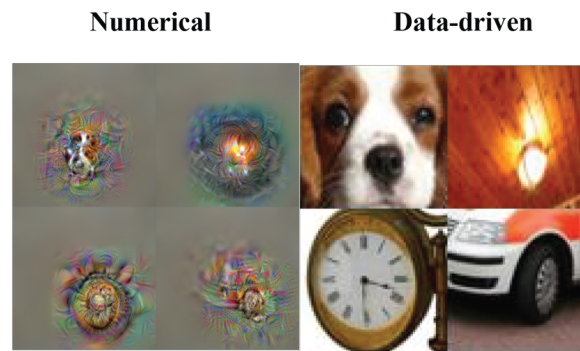

What about other AlexNet layers?

Conv 1: Edge+Blob

Conv 3: Texture

Conv 5: Object Parts

Fc8: Object Classes

Analyzing a CNN

- Performance tells you *how well* it learns
- Analysis tells you *what* it learns
- Analysis methods still under development
- For any node n :
 - Identify the training samples generating the highest activations
 - Compute $\partial C / \partial n$, use gradient ascent to create maximal activation image
 - Images do not look “real”
 - Add additional constraints (like minimizing L2) to create smooth inputs

Gradient-ascent Analysis

- Images generated by using partial derivatives to create images that maximize activations
- These images also use L2 regularization to avoid images that look like white noise

Tensorflow Learning Resources

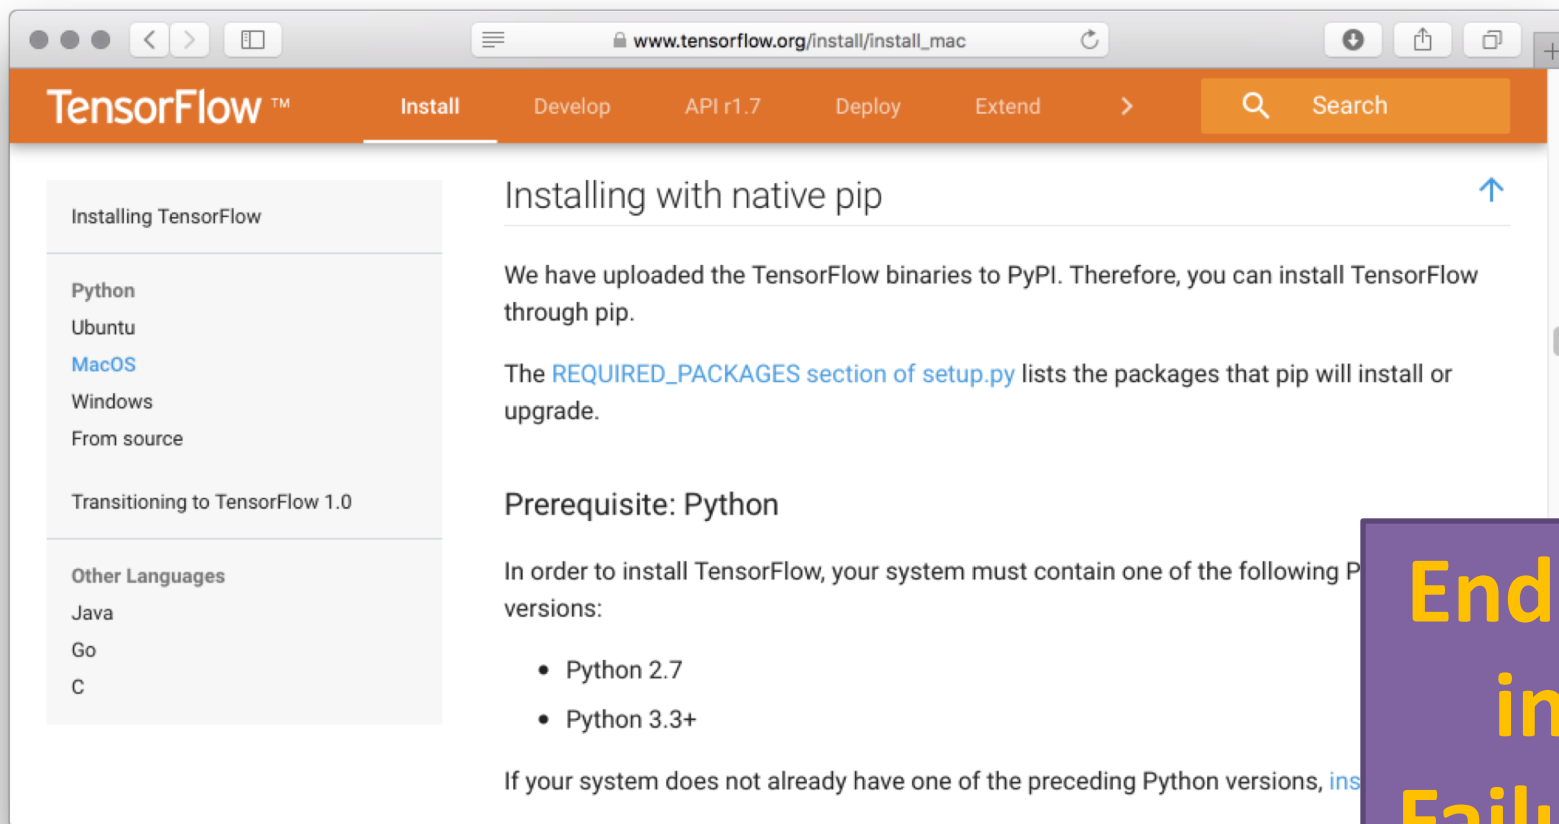

- First if course, tensorflow.org ...
- Then ...

Tensorflow

The web contains many helpful tutorials on tensorflow. I have only begun to scratch the surface. That caveat offered, I found these helpful.

- [TensorFlow 101 \(Really Awesome Intro Into TensorFlow\)](#). This is a relatively long but I thought really excellent walk through to set the context for Tensorflow.
- [TensorFlow Tutorial - How to use TensorFlow to Build a Neural Network](#). This is relatively shorter - just under 8 minutes - introduction with an emphasis on image recognition.
- [Dan Aloni's blog post on Back Propagation with TensorFlow](#). We will use this tutorial to begin digging into the basics of using Tensorflow.

Using Conda

- First, install
- Next, update your unix path

```
[Hinton:tf/tutorials/alon] ross% which conda  
/Users/ross/anaconda2/bin/conda
```

- Now review basic commands
 - update
 - install
 - list

More Basics - iPython

```
IPython: tutorials/aloni — ipython — 81x20
[Hinton:tf/tutorials/aloni] ross% which ipython
/Users/ross/anaconda2/bin/ipython
[Hinton:tf/tutorials/aloni] ross% ipython
Python 2.7.14 |Anaconda custom (64-bit)| (default, Dec  7 2017, 11:07:58)
Type "copyright", "credits" or "license" for more information.

IPython 5.4.1 -- An enhanced Interactive Python.
?                -> Introduction and overview of IPython's features.
%quickref        -> Quick reference.
help             -> Python's own help system.
object?         -> Details about 'object', use 'object??' for extra details.

In [1]: import tensorflow as tf

In [2]: tf.__version__
Out[2]: '1.1.0'

In [3]:
```

Add two (constant) Numbers

- From documentation on `tf.Session`
- Start thinking about a data flow graph

```
# Build a graph.  
a = tf.constant(5.0)  
b = tf.constant(6.0)  
c = a * b  
  
# Launch the graph in a session.  
sess = tf.Session()  
  
# Evaluate the tensor `c`.  
print(sess.run(c))
```

Add two Variables

- This is a bit more tricky
- The global variable initializer is important!

```
[In [3]: a = tf.Variable(3.0)

[In [4]: b = tf.Variable(4.0)

[In [5]: c = a + b

[In [6]: init_op = tf.global_variables_initializer()

[In [7]: sess.run(init_op)

[In [8]: sess.run(c)
Out[8]: 7.0
```
