

Flow of Control: Branching (Savitch, Chapter 3)

TOPICS

- Conditional Execution
- if and else Statement
- Boolean Data
- switch Statement

1

if Statement

- Ensures that a statement is executed only when some condition is **true**
- Conditions typically involve comparison of variables or quantities for equality or inequality
- Example:

```
if (age >= 18) {  
    System.out.println("You are eligible to vote.");  
}
```

Expression in parenthesis must evaluate to either true or false

CS 160, Spring Semester 2014

2

The if Statement

- The *if statement* has the following syntax

if is a Java reserved word

```
if ( condition )  
    statement;
```

If the *condition* is true, the *statement* is executed.
If it is false, the *statement* is skipped.

The *condition* must be a boolean expression. It must evaluate to either true or false.

if Statement with else

- An **if** statement may have an optional **else** clause that will only be executed when the condition is false

- Example:

```
if ( wages <= 57600.0 )
    tax = 0.124 * wages;
else
    tax = 0.124 * 57600.0;
```

CS 160, Spring Semester 2014

5

Defining Blocks

- To execute more than one statement conditionally, use **{ } to define a block** (aka “compound statement”) for the sequence of statements

- Example:

```
if (firstNumber <= secondNumber)
{
    quotient = secondNumber / firstNumber;
    remainder = secondNumber % firstNumber;
}
else
{
    quotient = firstNumber / secondNumber;
    remainder = firstNumber % secondNumber;
}
```

CS 160, Spring Semester 2014

6

Cascading if-else Statements

- Example:

```
if (condition1)
    statement1;
else
    if (condition2)
        statement2;
    else
        statement3;
```

CS 160, Spring Semester 2014

7

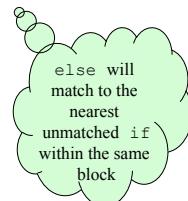

Dangling else

- Code written:

```
if (condition1)
    if (condition2)
        statement1;
    else
        statement2;
```

Be sure to use indentation properly
Otherwise too difficult to read!

- Which **if** does the **else** finish?

CS 160, Spring Semester 2014

8

Fix dangling else using blocks

- Code written:

```
if (condition1)
{
    if (condition2)
        statement1;
}
else
    statement2;
```

CS 160, Spring Semester 2014

9

boolean Data Type

- boolean

- A primitive data type that can be set to:

- true
- false

- Example:

```
boolean correct = true;
```

Notice there are no quotation marks around true and false!

CS 160, Spring Semester 2014

10

Boolean Expressions

- Conditions are expressions that have a truth value.
- Arithmetic relational operators produce a truth value, e.g.,

– $10 < 3$
– $x > y$
– $a \geq (b + 12)$

CS 160, Spring Semester 2014

11

boolean Operators

- Logical “and” (conjunction)

– Java symbol `&&`
– Math symbol \wedge
– true only when both expressions are true
 $(\text{MINIMUM_WAGE} \leq \text{wages}) \ \&\& \ (\text{wages} \leq \text{MAXIMUM_WAGE})$

- Logical inclusive “or” (disjunction)

– Java symbol `||`
– Math symbol \vee
– true when either or both expressions are true
 $(\text{wages} < \text{MINIMUM_WAGE}) \ \mid\mid \ (\text{wages} > \text{MAXIMUM_WAGE})$

CS 160, Spring Semester 2014

12

boolean Operators (cont.)

- Logical “exclusive or”
 - Java symbol `^`
 - Math symbol `\oplus`
 - true when exactly one of the expressions is true
 $(\text{MINIMUM_WAGE} < \text{wages}) \wedge (\text{MINIMUM_WAGE} == \text{wages})$
- Logical “not” (negation)
 - Java symbol `!`
 - Math symbol `\neg`
 - $!(\text{MINIMUM_WAGE} == \text{wages})$

CS 160, Spring Semester 2014

13

Java Logical and Arithmetic Operator Precedence Rules

1. `!` - (unary)
2. `*` `/` `%`
3. `+` `-`
4. `<` `<=` `>` `<=`
5. `==`
6. `^` `&` `|`
7. `&&`
8. `||`

CS 160, Spring Semester 2014

14

Complicated Boolean Expressions

```
boolean isLeapYear = ((year % 4) == 0)
    && ((year % 100) != 0)
    || ((year % 400) == 0);
```

Interpretation:

- Leap years are every four years (divisible by 4) except for centuries that are not divisible by 400.

CS 160, Spring Semester 2014

15

Combining Relational Operators

- Unlike some other operators, relational cannot be combined in Java.
- Example:
 $(a \leq b \leq c)$
 - Does not mean $a \leq b$ and $b \leq c$.
 - It produces a compile-time error -- cannot compare a boolean (return value of `<=` operator) with a number.
 - How should this be done?

CS 160, Spring Semester 2014

16

switch Statement

- Used to accomplish multi-way branching based on the value of an integer selector variable

- Example:

```
switch (numberOfPassengers)
{
    case 0: System.out.println("The Harley");
              break;
    case 1: System.out.println("The Dune Buggy");
              break;
    default:
              System.out.println("The Humvee");
}
```

Expression in ()
must evaluate to an
int or **char** ONLY!

break moves
flow of control to
end of switch
statement

default case is executed if
no other case values match
expression

Don't need a break after
default – already at end

CS 160, Spring Semester 2014

17

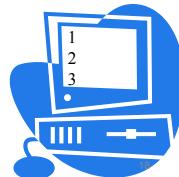

Using break in switch statements

- Consider the code fragment below

```
int i = 1;
switch (i)
{
    case 0: System.out.println("0");
    case 1: System.out.println("1");
    case 2: System.out.println("2");
    case 3: System.out.println("3");
}
System.out.println();
```

- Without breaks what is the output?

(note: it is legal to leave out the
breaks and sometimes desired)

CS 160, Spring Semester 2014

Why execute multiple cases?

- Consider if you want a base level with add-ons for increasing numbers as in...

```
switch (zoomember_level)
{
    case 500: System.out.print(" Meet a tiger");
    case 100: System.out.print(" Free t-shirt");
    case 50: System.out.print("Free admission!");
    default: System.out.println();
}
```

- Example of when we want to leave off the break statements to allow execution to follow through

CS 160, Spring Semester 2014

19

Symbolic Constants in switch Statements

```
final int
SUNDAY = 1, MONDAY = 2, TUESDAY = 3,
WEDNESDAY = 4, THURSDAY = 5, FRIDAY = 6,
SATURDAY = 7;
int d;
...
switch (d) {
    case SUNDAY: System.out.print("Sunday"); break;
    case MONDAY: System.out.print("Monday"); break;
    case TUESDAY: System.out.print("Tuesday"); break;
    case WEDNESDAY: System.out.print("Wednesday"); break;
    case THURSDAY: System.out.print("Thursday"); break;
    case FRIDAY: System.out.print("Friday"); break;
    case SATURDAY: System.out.print("Ski day"); break;
}
```

CS 160, Spring Semester 2014

20

Multiple case Labels

```
switch (d) {
    case MONDAY:
    case WEDNESDAY:
    case FRIDAY:
        System.out.println("C.S. meets at 9:00 today");
        System.out.println("Math meets at 10:00 today");
        break;
    case TUESDAY:
    case THURSDAY:
        System.out.println("English meets at 9:00 today");
        System.out.println("Chemistry meets at 10:00 today");
        break;
    case SUNDAY:
    case SATURDAY:
        System.out.println("Enjoy the weekend");
}
```

CS 160, Spring Semester 2014

21

switch example

- Display the students' grade based on entering their grade as an int between 0 and 100 (90+ = A, 80-89 = B, 70-79 = C)

```
switch( grade / 10 )
{
    case 10:
    case 9:
        System.out.println( "A" );
        break;
    case 8:
        System.out.println( "B" );
        break;
    case 7:
        System.out.println( "C" );
        break;
    default:
        System.out.println( "F" );
}
```

Integer division
is our friend!

CS 160, Spring Semester 2014

22

Comparing switch and if statements

- switch statement

```
switch (expression)
{
    case value1: statement1;
    break;
    case value2: statement2;
    break;
    ...
    case valueX: statementX;
    break;
    default: statementY;
}
```

- if equivalent

```
value = expression;
if (value == value1)
    statement1;
else if (value == value2)
    statement2;
...
else if (value == valueX)
    statementX;
else
    statementY;
```

CS 160, Spring Semester 2014

23

Comparing switch and if statements

Print out whether the char ch is a vowel or not

- switch statement

```
switch (letter)
{
    case 'A': case 'a':
    case 'E': case 'e':
    case 'I': case 'i':
    case 'O': case 'o':
    case 'U': case 'u':
        System.out.println( "vowel" );
        break;
    default:
        System.out.println( "consonant" );
}
```

- if equivalent

```
if ( (letter == 'A' || letter == 'a'
    || letter == 'E' || letter == 'e'
    || letter == 'I' || letter == 'i'
    || letter == 'O' || letter == 'o'
    || letter == 'U' || letter == 'u' )
    )
    System.out.println( "vowel" );
else
    System.out.println( "consonant" );
```

CS 160, Spring Semester 2014

24

Summary

- Flow of control
- **if** statements
- **boolean** expressions
- **if-else** statements
- Order of operations
- Relational operators
- **switch** statement
