Chapter 8 Multidimensional Arrays

CS1: Java Programming Colorado State University

Original slides by Daniel Liang Modified slides by Chris Wilcox

Motivations

Thus far, you have used one-dimensional arrays to model linear collections of elements. You can use a two-dimensional array to represent a matrix or a table. For example, the following table that describes the distances between the cities can be represented using a two-dimensional array.

	Distance Table (in miles)						
	Chicago	Boston	New York	Atlanta	Miami	Dallas	Houston
Chicago	0	983	787	714	1375	967	1087
Boston	983	0	214	1102	1763	1723	1842
New York	787	214	0	888	1549	1548	1627
Atlanta	714	1102	888	0	661	781	810
Miami	1375	1763	1549	661	0	1426	1187
Dallas	967	1723	1548	781	1426	0	239
Houston	1087	1842	1627	810	1187	239	0

Motivations

```
double[][] distances = {
    {0, 983, 787, 714, 1375, 967, 1087},
    {983, 0, 214, 1102, 1763, 1723, 1842},
    {787, 214, 0, 888, 1549, 1548, 1627},
    {714, 1102, 888, 0, 661, 781, 810},
    {1375, 1763, 1549, 661, 0, 1426, 1187},
    {967, 1723, 1548, 781, 1426, 0, 239},
    {1087, 1842, 1627, 810, 1187, 239, 0},
};
```

Objectives

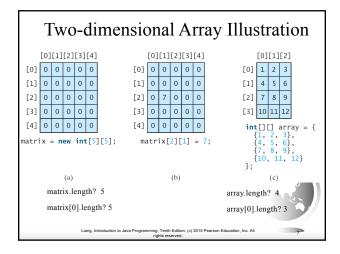

- ☐ To give examples of representing data using two-dimensional arrays (§8.1).
- ☐ To declare variables for two-dimensional arrays, create arrays, and access array elements in a two-dimensional array using row and column indexes (§8.2).
- ☐ To program common operations for two-dimensional arrays (displaying arrays, summing all elements, finding the minimum and maximum elements, and random shuffling) (§8.3).
- ☐ To pass two-dimensional arrays to methods (§8.4).
- To write a program for grading multiple-choice questions using twodimensional arrays (§8.5).
- ☐ To solve the closest-pair problem using two-dimensional arrays (§8.6)
- ☐ To check a Sudoku solution using two-dimensional arrays (§8.7).
- ☐ To use multidimensional arrays (§8.8).

Declare/Create Two-dimensional Arrays // Declare array ref var dataType[][] refVar; // Create array and assign its reference to variable refVar = new dataType[10][10]; // Combine declaration and creation in one statement dataType[][] refVar = new dataType[10][10]; // Alternative syntax dataType refVar[][] = new dataType[10][10];

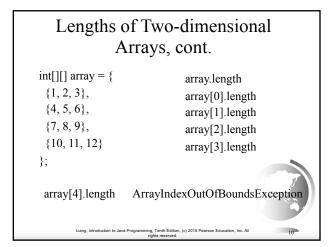

Declaring Variables of Twodimensional Arrays and Creating Two-dimensional Arrays int[][] matrix = new int[10][10]; or int matrix[][] = new int[10][10]; matrix[0][0] = 3; for (int i = 0; i < matrix.length; i++) for (int j = 0; j < matrix[i].length; j++) matrix[i][j] = (int) (Math.random() * 1000)

double[][] x;

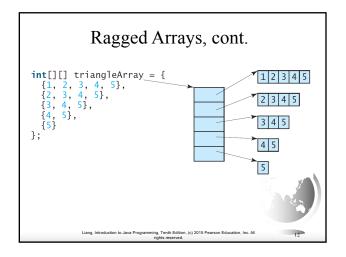

```
Ragged Arrays
Each row in a two-dimensional array is itself an array. So,
   the rows can have different lengths. Such an array is
   known as a ragged array. For example,
int[][] matrix = {
 \{1, 2, 3, 4, 5\},\
                                         matrix.length is 5
                                        matrix[0].length is 5
 \{2, 3, 4, 5\},\
                                       matrix[1].length is 4 matrix[2].length is 3
 \{3, 4, 5\},\
 {4, 5},
                                        matrix[3].length is 2
                                        matrix[4].length is 1
 {5}
};

```

Processing Two-Dimensional Arrays

See the examples in the text.

- 1. (Initializing arrays with input values)
- 2. (Printing arrays)
- 3. (Summing all elements)
- 4. (Summing all elements by column)
- 5. (Which row has the largest sum)
- 6. (Finding the smallest index of the largest element)
- 7. (Random shuffling)

Liang, Introduction to Java Programming, Tenth Edition, (c) 2015 Pearson Education, Inc. A

Initializing arrays with input values

```
java.util.Scanner input = new Scanner(System.in);
System.out.println("Enter " + matrix.length + " rows and " +
matrix[0].length + " columns: ");
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column++) {
    matrix[row][column] = input.nextInt();
  }
}
```

Initializing arrays with random values

```
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column+++) {
    matrix[row][column] = (int)(Math.random() * 100);
  }
}</pre>
```

Liang, Introduction to Java Programming, Tenth Edition, (c) 2015 Pearson Education, Inc. Al

Printing arrays

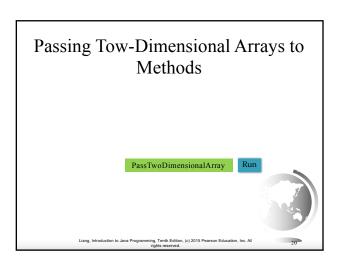

```
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column++) {
    System.out.print(matrix[row][column] + " ");
  }
  System.out.println();
}</pre>
```

```

Multidimensional Arrays

Occasionally, you will need to represent n-dimensional data structures. In Java, you can create n-dimensional arrays for any integer n.

The way to declare two-dimensional array variables and create two-dimensional arrays can be generalized to declare n-dimensional array variables and create n-dimensional arrays for n >= 3.

Problem: Calculating Total Scores

Objective: write a program that calculates the total score for students in a class. Suppose the scores are stored in a three-dimensional array named scores. The first index in scores refers to a student, the second refers to an exam, and the third refers to the part of the exam. Suppose there are 7 students, 5 exams, and each exam has two parts—the multiple-choice part and the programming part. So, scores[i][i][0] represents the score on the multiple-choice part for the i's student on the i's student. Your program displays the total score for each student.

Problem: Weather Information

Suppose a meteorology station records the temperature and humidity at each hour of every day and stores the data for the past ten days in a text file named weather.txt. Each line of the file consists of four numbers that indicate the day, hour, temperature, and humidity. Your task is to write a program that calculates the average daily temperature and humidity for the 10 days.

Problem: Guessing Birthday

Listing 4.3, GuessBirthday.java, gives a program that guesses a birthday. The program can be simplified by storing the numbers in five sets in a three-dimensional array, and it prompts the user for the answers using a loop.
