 Methodologies for creating computer programs that perform a desired function.

## Problem Solving

- How do we figure out what to tell the computer to do?
- Convert problem statement into algorithm, using stepwise refinement.
- Convert algorithm into LC-3 machine instructions.

## Debugging

- How do we figure out why it didn't work?
- Examine registers and memory, set breakpoints, etc.

Time spent on the first can reduce time spent on the second! CS 270 - Fall Semester 2015

## Stepwise Refinement

- Also known as systematic decomposition.
  Start with problem statement:
  - "We wish to count the number of occurrences of a character in a file. The character in question is to be input from the keyboard; the result is to be displayed on the monitor."
- Decompose task into a few simpler subtasks.
- Decompose each subtask into smaller subtasks, and these into even smaller subtasks, etc.... until you get to the machine instruction level.

- Tell the simulator to stop when a register or memory location changes or when it equals a specific value.
- Useful when you don't know where or when a value is changed.
