

Standard C Library

I/O commands are not included as part of the C language.

- Instead, they are part of the Standard C Library.
 - A collection of functions and macros that must be implemented by any ANSI standard implementation.
 - Automatically linked with every executable.
 - Implementation depends on processor, operating system, etc., but interface is standard.
- Since they are not part of the language, compiler must be told about function interfaces.
- Standard header files are provided, which contain declarations of functions, variables, etc.

• The standard I/O functions are declared in the <stdio.h> header file.

Function Description

putchar	Displays an ASCII character to the screen.		
getchar	Reads an ASCII character from the keyboard.		
printf	Displays a formatted string,		
scanf	Reads a formatted string.		
fopen	Open/create a file for I/O.		
fprintf	Writes a formatted string to a file.		
fscanf	Reads a formatted string from a file.

Text Streams

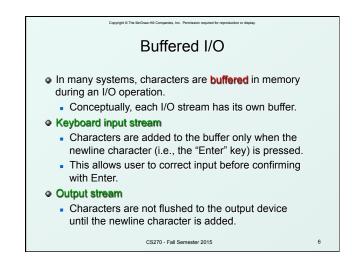

• All character-based I/O in C is performed on text streams.

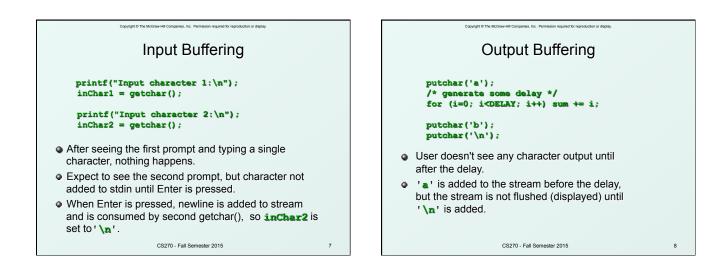

Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

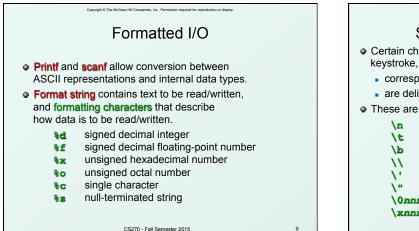

- A stream is a sequence of ASCII characters, such as:
 - the sequence of ASCII characters printed to the monitor by a single program
 - the sequence of ASCII characters entered by the user during a single program
 - the sequence of ASCII characters in a single file
- Characters are processed in the order in which they were added to the stream.
 - e.g., a program sees input characters in the same order as the user typed them.
 - Standard input stream (keyboard) is called stdin.
 - Standard output stream (monitor) is called stdout.

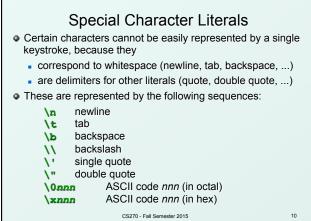

CS270 - Fall Semester 2015

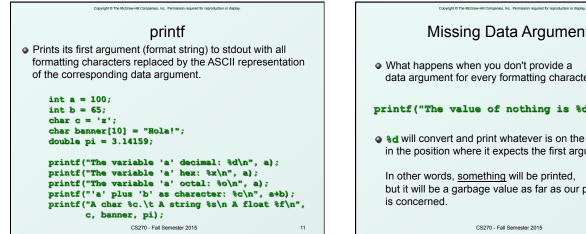

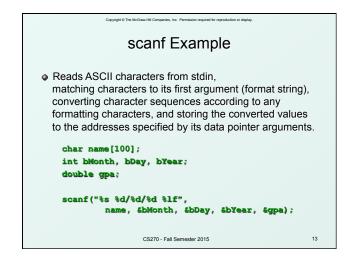

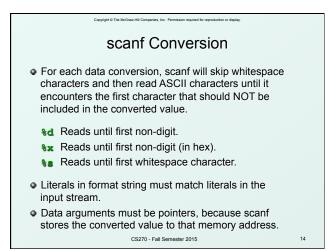

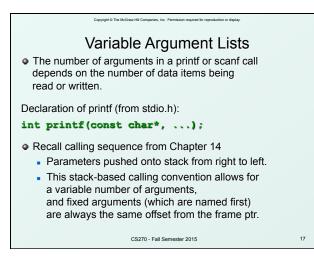

Missing Data Arguments What happens when you don't provide a data argument for every formatting character? printf("The value of nothing is %d\n"); • **%d** will convert and print whatever is on the stack in the position where it expects the first argument. In other words, something will be printed, but it will be a garbage value as far as our program

scanf Return Value	Bad scanf Arguments
 The scanf function returns an integer, which indicates the number of successful conversions performed. This lets the program check whether the input stream was in the proper format. Example: scanf("%s %d/%d/%d %lf", name, 6bMonth, 6bDay, 6bYear, 6gpa); Input Stream Return Value Mudd 02/16/69 3.02 5 Muss 02 16 69 3.02 2 Doesn't match literal '/', so scanf guits 	 Two problems with scanf data arguments Not a pointer int n = 0; scanf ("%d", n); Will use the value of the argument as an address. Missing data argument scanf ("%d"); Will get address from stack. If you're lucky, program will crash because of trying to modify a restricted memory location (e.g., location 0). Otherwise, your program will just modify an arbitrary memory location,
after second conversion.	which can cause very unpredictable behavior.
CS270 - Fall Semester 2015 15	CS270 - Fall Semester 2015 16

fopen
The fopen (pronounced "eff-open") function associates a physical file with a stream.
FILE *fopen (char* name, char* mode);
First argument: name
The name of the physical file, or how to locate it on the storage device. This may be dependent on the underlying operating system.
Second argument: mode
How the file will be used:

"x" - read from the file
"y" - write, starting at the beginning of the file
"a" - write, starting at the end of the file (append)

CS270 - Fall Semester 2015

19

fprintf and fscanf
 Once a file is opened, it can be read or written using fscanf() and fprintf(), respectively.
 These are just like scanf() and printf()

Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

 These are just like scanf () and printf (), except an additional argument specifies a file pointer:

fprintf(outfile, "The answer is %d\n", x);

sprintf and sscanf	
• These are just like fscanf() and fprintf() , except the additional argument specifies a string instead of a file pointer:	
char string[80];	
sprintf(string, "The answer is $d \in $, x);	
<pre>sscanf(string, "%s %d/%d/%d %lf", name, &bMonth, &bDay, &bYear, &gpa);</pre>
