

CS 370: OPERATING SYSTEMS

[VIRTUAL MEMORY]

Shrideep Pallickara
Computer Science
Colorado State University

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

1

Frequently asked questions from the previous class survey

- Belady's anomaly
 - ▣ Does it still occur? Do current OS rely on stack algorithms?
- Are pages removed from the backing store?
 - ▣ Why block transfers?
- How does demand paging "guess" which pages to bring in? Can you have mix of demand and non-demand paging in the same system?
- Page faults:
 - ▣ Is the user made aware of them? Or is handled transparently?
 - ▣ Can the OS pivot to some other process when this happens?
- Is there a way to maintain a set of victim frames?
- Page table entries?

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.2

2

Topics covered in this lecture

- Page replacement algorithms
- Page Buffering
- Frame Allocations
- Working Sets
- TLB Reach

COLORADO STATE UNIVERSITY

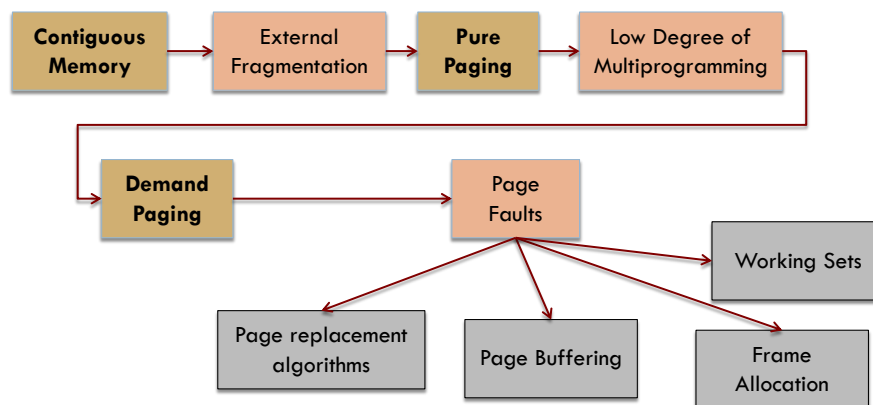

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.3

3

How we got here ...

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.4

4

THE OPTIMAL PAGE REPLACEMENT ALGORITHM

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

5

The optimal page replacement algorithm

- The best possible algorithm
- Easy to describe but **impossible to implement**
- **Crux:**
 - Put off unpleasant stuff for as long as possible

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.6

6

The optimal page replacement algorithm description

- When a page fault occurs some set of pages are in memory
- One of these pages will be referenced next
 - ▣ Other pages may be not be referenced until 10, 100 or 1000 instructions later
- **Label** each page with the number of instructions to be executed **before** it will be referenced
 - ▣ When there is a page-fault, the page with the highest label should be removed

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.7

7

Problem with the optimal page replacement algorithm

- It is **unrealizable**
- During a page fault, the OS has no way of knowing **when** each of the pages will be referenced next

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.8

8

So why are we looking at it?

- Run a program
 - ▣ Track all page references
- Implement optimal page replacement on the second run
 - ▣ Based on reference information from the first run
- **Compare** performance of **realizable** algorithms with the best possible one

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.9

9

LRU PAGE REPLACEMENTS

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

10

The Least Recently Used (LRU) page replacement algorithm

- Approximation of the optimal algorithm
- Observation
 - ▣ Pages used heavily in the last few instructions
 - Probably will be used heavily in the next few
 - ▣ Pages that have not been used
 - Will probably remain unused for a long time
- When a page fault occurs?
 - ▣ Throw out page that has been **unused the longest**

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.11

11

LRU example: 3 memory frames

		Reference String																			
		7	0	1	2	0	3	0	4	2	3	0	3	2	1	2	0	1	7	0	1
Recent		7	0	1	2	0	3	0	4	2	3	0	3	2	1	2	0	1	7	0	1
		7	0	1	2	0	3	0	4	2	3	0	3	2	1	2	0	1	7	0	1
Least Used				7	0	1	2	2	3	0	4	2	2	0	3	3	1	2	0	1	7

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.12

12

Implementing LRU

- Logical clock
- Stacks

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.13

13

Using Logical clocks to implement LRU

- Each page table entry has a **time-of-use** field
 - ▣ Entry updated when page is referenced
 - Contents of clock register are copied
- Replace the page with the smallest value
 - ▣ Time increases monotonically
 - **Overflows** must be accounted for
- Requires search of page table to find LRU page

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.14

14

Stack based approach

- Keep stack of page numbers
 - When page is referenced
 - ▣ Move to the top of the stack
- Implemented as a doubly linked list
- No search done for replacement
 - ▣ Bottom of the stack is the LRU page

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.15

15

Problems with clock/stack based approaches to LRU replacements

- Inconceivable without hardware support
 - ▣ Few systems provide requisite support for true LRU implementations
- Updates of clock fields or stack needed at **every** memory reference
- If we use interrupts and do software updates of data structures things would be very slow
 - ▣ Would slow down every memory reference
 - At least 10 times slower

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.16

16

LRU APPROXIMATION PAGE REPLACEMENTS

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

17

LRU Approximation: Reference bit

- **Reference bit** associated with page table entries
- Reference bit is set by hardware when page is referenced
 - ▣ Read/write access of the page
- Determine which page has been used and which has not
 - ▣ No way of knowing the *order of references* though

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.18

18

LRU Approximation: Additional reference bits

- Maintain 8-bit byte for each page in memory
- OS **shifts** the reference bit for page into the highest order bit of the 8-bit byte
 - ▣ Operation performed at *regular intervals*
 - ▣ The reference bit is then *cleared*

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.19

19

LRU approximation: Reference bits

Shift Register	Reference bit for the page	Shift Register after the OS timer interrupt
00000000	1	10000000
10010001	1	11001000
01100011	0	00110001

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.20

20

LRU Approximation: Interpreting the reference bits

- Interpret 8-bit bytes as **unsigned integers**
- Page with the lowest number is the LRU page
- 00000000 : Not used in last 8 periods
- 01100101 : Used 4 times in the last 8 periods
- 11000100 used **more recently** than 01110111

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.21

21

The Second Chance Algorithm

- Simple modification of FIFO
- Avoids throwing out a heavily used page
- Inspect the reference bit of a page
 - ▣ If it is **0**: Page is old and unused
 - **Evict**
 - ▣ If it is **1**: Page is given a second chance
 - Move page to the end of the list

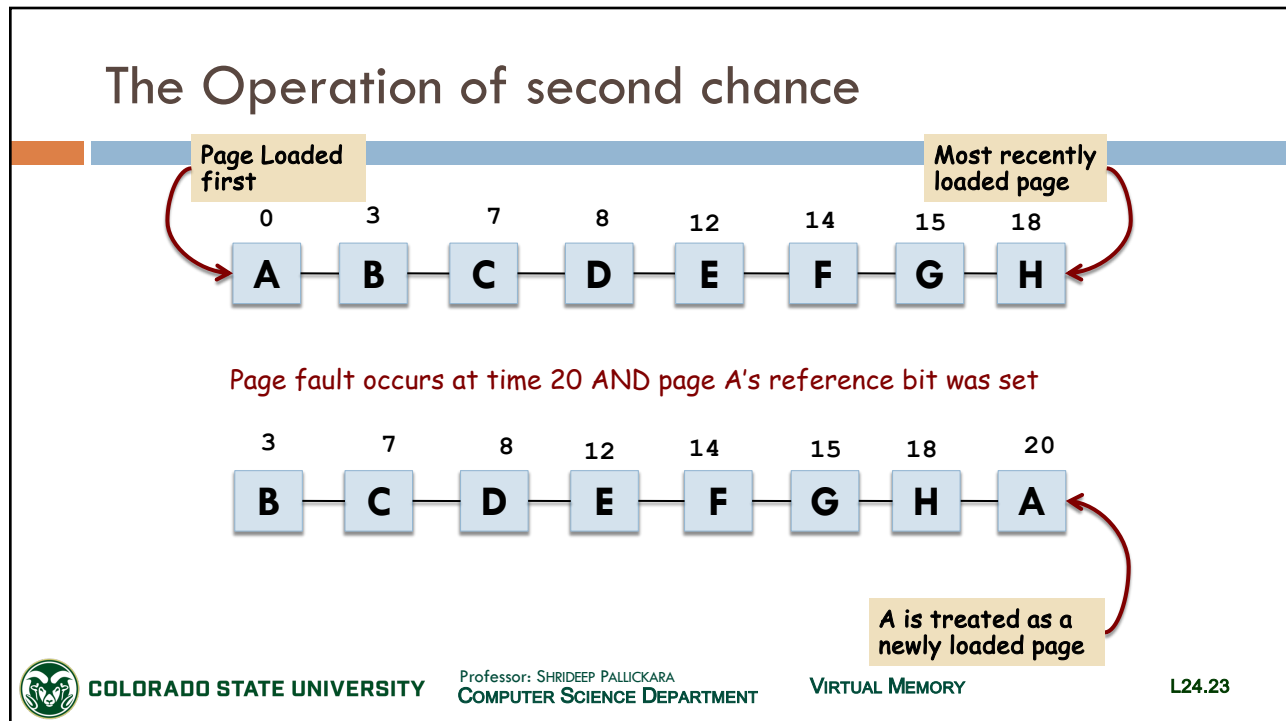

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.22

22

23

Second chance

- Reasonable algorithm, but unnecessarily **inefficient**
 - Constantly moving pages around on its list
- Better to keep pages in a circular list
 - In the form of a clock ...

COLORADO STATE UNIVERSITY Professor: SHRIDEEP PALICKARA COMPUTER SCIENCE DEPARTMENT VIRTUAL MEMORY L24.24

24

Clock Page Replacement

- Keep all frames on a circular list in the form of a clock
 - ▣ Hand points to the oldest page
- When a page fault occurs, page being pointed to by the hand is inspected
 - ▣ If its R bit is 0: the page is evicted
 - New page is inserted into the clock in its place
 - Hand is advanced one position
 - ▣ If its R bit is 1
 - It is cleared and the hand is advanced one position until a page is found with $R = 0$

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.25

25

Counting based page replacements Most Frequently Used (MFU)

- **Argument:**
Page with the smallest count was probably just brought in

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.26

26

Summary of Page Replacement Algorithms

Algorithm	Comment
Optimal	Not implementable, but useful as a benchmark
FIFO (First-In, First-Out)	Might throw out important pages
Second chance	Big improvement over FIFO
Clock	Realistic
LRU (Least Recently Used)	Excellent, but difficult to implement
NFU (Not Frequently Used)	Fairly crude approximate to LRU
Aging [Multiple reference bits]	Efficient algorithm that approximates LRU well

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.27

27

PAGE BUFFERING ALGORITHMS

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

28

Page Buffering

- ① Maintain a buffer of free frames
- ② When a page-fault occurs
 - ▣ Victim frame chosen as before
 - ▣ Desired page read into free-frame **from buffer**
 - **Before** victim frame is written out
 - ▣ Process that page-faulted can restart much faster

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.29

29

Page Buffering: Being proactive

- ▣ Maintain a list of **modified** pages
- ▣ When the paging device is **idle?**
 - ▣ Write modified pages to disk
- ▣ Implications
 - ▣ If a page is selected for replacement *increase likelihood* of that page being clean

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.30

30

Page Buffering: Reuse what you can

- Keep pool of free frames as before
 - ▣ BUT **remember** which pages they held
- Frame contents are not modified when page is written to disk
- If page needs to come back in?
 - ▣ **Reuse** the same frame, if it was not used to hold some other page

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.31

31

Buffering and applications

- Applications often understand their memory/disk usage better than the OS
 - ▣ Provide their own buffering schemes
- If both the OS and the application were to buffer
 - ▣ Twice the I/O is being utilized for a given I/O

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.32

32

ALLOCATION OF FRAMES

COMPUTER SCIENCE DEPARTMENT

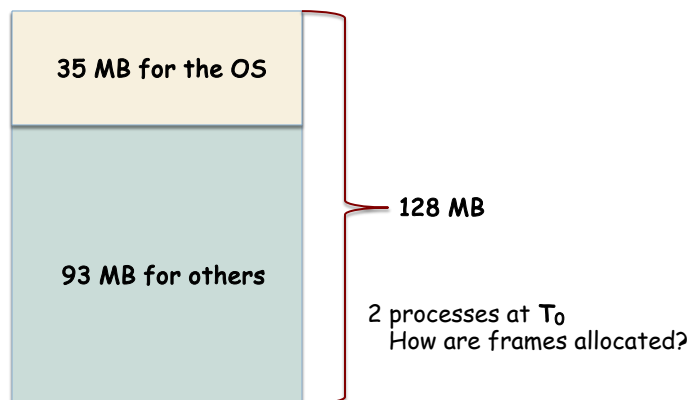

COLORADO STATE UNIVERSITY

33

Frame allocation: How do you divvy up free memory among processes?

Frame size = 1 MB; Total Size = 128 MB

With demand paging all 93 frames would be in the free frame pool

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.34

34

Constraints on frame allocation

- **Max:** Total number of frames in the system
 - ▣ Available physical memory

- **Min:** We need to allocate at least a minimum number of frames
 - ▣ Defined by the architecture of the underlying system

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.35

35

Minimum number of frames

- As you decrease the number of frames for a process
 - ▣ Page fault increases
 - ▣ Execution time increases too

- Defined by the **architecture**
 - ▣ In some cases, instructions and operands (indirect references) straddle page boundaries
 - With 2 operands at least 6 frames needed

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.36

36

FRAME ALLOCATION POLICIES

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

37

Global vs Local Allocation

- Global replacement
 - ▣ One process can **take** a memory frame from another process
- Local replacement
 - ▣ Process can only choose from the set of frames that was allocated to it

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.38

38

Local vs Global replacement: Based on how often a page is referenced

Pages	Usage Count	Pages	Pages
A1	10	A1	A1
A2	7	A2	A2
A3	5	A3	A3
A4	3	A5	A4
B1	9	B1	B1
B2	4	B2	B2
B3	2	B3	A5
B4	6	B4	B4
C1	3	C1	C1
C2	5	C2	C2
C3	6	C3	C3

Processes A, B and C

Local Replacement

Global Replacement

Process A has page faulted and needs to bring in a page

 **COLORADO STATE UNIVERSITY** Professor: SHRIDEEP PALICKARA
 COMPUTER SCIENCE DEPARTMENT VIRTUAL MEMORY L24.39

39

Global vs Local Replacement

	Local	Global
Number of frames allocated to process	Fixed	Varies dynamically
Can process control its own fault rate?	YES	NO
Can it use free frames that are available?	NO	YES
Increases system throughput?	NO	YES

 **COLORADO STATE UNIVERSITY** Professor: SHRIDEEP PALICKARA
 COMPUTER SCIENCE DEPARTMENT VIRTUAL MEMORY L24.40

40

WORKING SETS & THRASHING

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

41

Locality of References

- During any phase of execution, a process references a relatively small **fraction** of its pages
- Set of pages that a process is currently using
 - ▣ **Working set**
- Working set **evolves** during process execution

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.42

42

Implications of the working set

- If the entire working set is in memory
 - ▣ Process will execute without causing many faults
 - Until it moves to *another phase* of execution
- If the available memory is too small to hold the working set?
 - ① Process will cause many faults
 - ② Run very slowly

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.43

43

A program causing page faults every few instructions is said to be thrashing

- System throughput **plunges**
 - ▣ Processes spend all their time paging
- Increasing the degree of multiprogramming can cause this
 - ▣ New process may **steal** frames from another process {*Global Replacement*}
 - Overall page-faults in the system increases

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.44

44

45

Mitigating the effects of thrashing

- Using a local page replacement algorithm
 - ▣ One process thrashing does not cause **cascading thrashing** among other processes
 - ▣ BUT if a process is thrashing?
 - Average service time for a page fault increases
- Best approach
 - ① Track a process' working set
 - ② Make sure the working set is in memory **before** you let it run

COLORADO STATE UNIVERSITY Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT VIRTUAL MEMORY L24.46

46

WORKING SETS & THRASHING

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

47

Working set is an approximation of the program's locality

- Most important property of the working set is its **size**

Page reference table

... 2 6 1 5 7 7 7 7 5 1 6 2 3 4 4 4 3 4 3 4 4 4 1 2 3 4 8

Δ

WS = {1, 2, 5, 6, 7}

Δ

WS = {3, 4}

- WSS_i = Working set size for process p_i
- If total demand exceeds available frames
 - Thrashing will occur

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.48

48

Working sets and page fault rates

- The peak in page-fault rate happens when a *new locality* is being demand-paged
- Once working set is in memory
 - ▣ Page fault rate falls
- When process moves towards a new working set window?
 - ▣ Fault rate rises again

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.49

49

The page fault frequency approach to reducing thrashing

- When the page fault rate is high
 - ▣ Process needs *more* frames
- When the page fault rate is too low
 - ▣ Process may have *too many* frames

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.50

50

Using page fault frequencies to control thrashing: Establish bounds

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.51

51

OTHER CONSIDERATIONS

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

52

Prepaging: Loading pages BEFORE letting a process run

- Bring into memory -- **at one time** -- all the pages that will be needed
 - ▣ Prepage frames for small files
- With the working set model
 - ▣ Ensure that the **entire working set is in memory** before the process is resumed

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.53

53

TLB Reach is the amount of memory accessible from the TLB

- $TLB\text{-}Reach = \text{Number of TLB entries} \times \text{Page Size}$
- Approaches to increasing TLB reach
 - ▣ Double the entries
 - Expensive
 - ▣ Increase page size
 - Increases (internal) fragmentation
 - ▣ Support multiple page sizes
 - OS not hardware manages the TLB
 - Increase reach and hit ratio

} **Current trend**

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.54

54

Select data structures and program structures efficiently

- Increase locality
 - ▣ Reduce page fault rates
- Loops
 - ▣ If data is stored in *row-major* format, but program reads it as *column-major* format
- Loader should avoid placing routines across page boundaries

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA
COMPUTER SCIENCE DEPARTMENT

VIRTUAL MEMORY

L24.55
