

**May the Force be with you ... and adieu**

The power of abstractions —layered  
each layer hiding a tangled truth beneath

Processes fence off one another —self-contained,  
while threads run concurrent lives in a shared computing space

The scheduler decides  
who speaks next in the chorus of tasks  
caution, however: deadlocks lurk around the resource corner,  
where no task yields, and all is frozen

Memory management, the illusionist, stretches what is finite,  
beyond the silicon bounds of our beloved RAM  
powered by paging and segmentation  
a sleight of hand that makes bloatware possible

The file system arranges blocks into meaning,  
weaving together files as a tapestry of blocks

What seems a breeding ground for chaos,  
now dances in harmony  
and hums with activity

The OS built on unseen scaffolds — that we now know

## CS 370: OPERATING SYSTEMS

### [DISK SCHEDULING ALGORITHMS]

Shrideep Pallickara  
Computer Science  
Colorado State University

COLORADO STATE UNIVERSITY

1

## Frequently asked questions from the previous class survey

- Flash memory
  - ▣ More susceptible to hardware errors? Why do we set it to a logical “1”?
  - ▣ When you have lower capacity, and make modifications constantly, does this wear out the cells faster?
  - ▣ Do we need defragmentation here?
  - ▣ Is the slack space provided by manufacturers available for general use?
- RAIDs: Do we have nesting of these levels?
- What’s your favorite sci-fi movie?

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.2

2

## Topics covered in this lecture

- Coping with system failures
- Swap space management
- Disk scheduling algorithms
- Final Exam

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.3

3

4

## Coping with system failures

- File system structures are maintained on disk and in memory
- Operations result in **structural changes** to the file system on disk
  - ▣ Changes may be interrupted by a crash
- System failures should not result in
  - ▣ **Data Loss**
  - ▣ **Inconsistencies** among data structures

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.5

5

## Sources of inconsistency

- OSes **cache** to optimize performance
  - ▣ If cached changes do not reach disk?
    - Corruption
- **Bugs** may also corrupt a file system
  - ▣ File system implementation
  - ▣ Disk controllers
  - ▣ Applications

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.6

6

## Inconsistency example: File creation

- Directory structure is modified, inode is set aside, etc
- Free inode count may indicate that an inode has been allocated
  - ▣ But the directory structure may not point to it

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.7

7

## Consistency checking: Approaches

### (I) **Scan** all metadata of file system

- ▣ Confirm or deny consistency
- ▣ Time consuming

### (II) **Record** state within file system metadata

- ▣ At start of metadata change the *status bit* set
  - Metadata is in flux
- ▣ If metadata updates complete successfully
  - Clear the status bit
- ▣ If bit is set: a **consistency checker** is run

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.8

8

## Consistency checker compares structure with data on disk and tries to fix inconsistencies

- Allocation & free space management algorithms dictate efficiency and success
- Linked list allocation
  - ▣ Link exists from block to block
  - ▣ File can be recreated
- Indexed allocation
  - ▣ Loss of inode entry is disastrous
    - File blocks have **no knowledge** of each other

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.9

9

## Some issues with consistency checking

- Inconsistency may be **irreparable**
  - ▣ Inability to recover structures
  - ▣ Loss of files (possibly entire directories)
- Can require **human intervention** for conflict resolution
  - ▣ Unavailable until this is performed
- Can be very **time consuming**
  - ▣ Can take up to several hours

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.10

10

11

## Applying log-based recovery techniques to file system METADATA UPDATES

- All metadata changes are written sequentially to a **log**
- Changes written to log are considered **committed**
  - ▣ System call can return
- Log entries are **replayed** across actual file system structures

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.12

12

## Some things about the log file

- Implemented as a circular buffer
  - ▣ When action is completed
    - Buffer entry is removed and pointer is advanced
- Log **location**
  - ▣ Separate section of the file system
  - ▣ Perhaps on a separate disk
    - Efficiency

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.13

13

## After a system crash the log is inspected

- Log will contain zero or more transactions
- If there are **non-zero** transactions
  - ▣ Not completed but committed by the OS
    - Must be completed
  - ▣ Aborted transaction: Not committed before crash
    - Undone
- Recovery is much more **targeted**

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.14

14

## Benefits of using logging for disk metadata updates

- Costly synchronous random metadata writes
  - ▣ **Become** (less expensive) synchronous, sequential writes to the logging area
- Changes in the log are **replayed asynchronously** to appropriate disk structures
  - ▣ Random writes
- Updates are **much faster** than when they are applied directly to on-disk structures

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.15

15

## Other approaches

- **Never overwrite** blocks with new data {Used in Journaling}
- All data and metadata changes in new blocks
- When transaction completes
  - ▣ Structures **updated to point** to the new block
- Old blocks can be reused
  - ▣ If NOT, a snapshot preserves view before the update
- ZFS **checksums** all data and metadata blocks

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.16

16

## SWAP SPACE MANAGEMENT

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

17

### Virtual memory uses the disk space as an extension of main memory

- Using swap space **decreases** system performance
- Main objective of swap space
  - ▣ Provide best possible **throughput** for the virtual memory system

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.18

18

## Swap space location

- Not in the purview of the normal file system
  - ▣ Navigating directory and allocation data structures
    - Time consuming
    - Could result in additional disk accesses
- Use a **raw** partition
  - ▣ Separate swap-space manager
  - ▣ (De)allocate blocks from the raw partition

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.19

19

## Using the raw partition

- Swap space *accessed more frequently* than the file system
- Algorithms are optimized for **speed not efficiency**
- Internal fragmentation may be higher
  - ▣ BUT swap space data have shorter life spans
    - Acceptable trade-off

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.20

20

21

Disk drives are attached to the computer by a set of wires called an I/O bus

- ❑ Enhanced integrated drive electronics (EIDE)
- ❑ Advanced technology attachment (ATA)
- ❑ Serial ATA (SATA)
- ❑ Universal serial bus (USB)
- ❑ Small computer systems interface (SCSI)
- ❑ NonVolatile Memory express (NVMe)

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.22

22

## Disk controllers are built into each disk drive

- Computer **places** a command using memory mapped I/O ports
- Disk controller **operates** the disk hardware to perform command

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.23

23

## Magnetic tape

- Early secondary-storage medium
- **Slow access** times
  - ▣ Moving to the correct spot on tape is time consuming
  - ▣ 1000 times slower than magnetic disk for random access
- Mainly for **backup**

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.24

24

## Disk Structure

- One dimensional **array** of blocks
  - ▣ Mapped onto sectors of the disk
- Sector **0**
  - ▣ 1<sup>st</sup> sector of 1<sup>st</sup> track on outermost cylinder
    - A cylinder holds a group of tracks
- Mapping proceeds from the outermost cylinders to the innermost one

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.25

25

## Sectors on a hard disk

- {cylinder, track, sector}
- Disks have **defective** sectors
  - ▣ Manufacturers hide this by substituting spare sectors from elsewhere on disk
- Number of sectors per track
  - ▣ Not constant in some drives

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.26

26

## Rotation speed and density of disks

- Density of bits is uniform
  - ▣ Outer tracks have greater length
    - More sectors = greater capacity
  - ▣ Drive increases rotation speed as it moves from inner track to outer ones
    - **Constant linear velocity**
- Disk rotation can stay constant
  - ▣ Density of bits decreases from inner tracks to outer ones

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.27

27

28

## Disk scheduling: Objectives

- Fast **access times**
  - ▣ *Seek time*
    - Move disk arm to the right cylinder
  - ▣ *Rotational latency*
    - Rotate to the desired sector
- Disk **bandwidth**
  - ▣ Transfer rates

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.29

29

## Disk scheduling: Premise

- With many processes, there are many **pending** disk I/O requests
- Improve access time and bandwidth
  - ▣ By managing the **order** in which disk I/O requests are serviced

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.30

30

## Disk I/O request string

- We consider requests to I/O blocks on **cylinders (or tracks)**
- {98, 183, 37, 122, 14, 124, 65, 67}
  - ▣ Initial disk head position: 53
  - ▣ Number of cylinders: 200
    - 0-199

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.31

31

## First Come First Served Scheduling

- Process these requests in the order they arrive
- {98, 183, 37, 122, 14, 124, 65, 67}
- Wild swings
  - 183 → 37, 122 → 14
- Total disk-head movement is way too high
  - ▣ In our example: 640

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.32

32

## Plotting the disk head movement: FCFS

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.33

33

## Shortest-Seek-Time-First (SSTF) targets disk head movement

- Select request with the **lowest seek time**
  - ▣ Service requests closest to current disk head position
- {98, 183, 37, 122, 14, 124, 65, 67}
  - ▣ Initially at 53
- {65, 67, 37, 14, 98, 122, 124, 183}
  - ▣ Total disk-head movement= 236 cylinders

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

35

## Contrasting disk head movements in FCFS and SSTF

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.36

36

## SSTF

- This is a form of shortest-job-first
- Can cause **starvation** in some requests
- Not optimal
  - ▣ SSTF: {65, 67, 37, 14, 98, 122, 124, 183}
    - Total head movement: 236 cylinders
  - ▣ We can do better
    - Could have done: {53, 37, 14, 65, 67, 98, 122, 124, 183}
    - Total head movement: 208 cylinders

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.37

37

## SCAN SCHEDULING AND VARIANTS

COMPUTER SCIENCE DEPARTMENT

COLORADO STATE UNIVERSITY

38

## SCAN scheduling

- Start at one end of disk & move to the other end
  - ▣ Servicing requests
- Reverse directions at the other end
- Also called **elevator** algorithm

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.39

39

## Before applying the algorithm to our schedule

- We need to know
  - ▣ The disk head's current **position**
  - ▣ **Direction** of the head movement
- {98, 183, 37, 122, 14, 124, 65, 67}
  - ▣ Initially at 53
  - ▣ Disk arm is moving towards 0
- {14, 37, 65, 67, 98, 122, 124, 183}

← 53

40

## Plot of the disk head movement in SCAN scheduling

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.41

41

## SCAN scheduling

- When requests have been serviced
  - ▣ From one end to other
- When the disk head reaches one end
  - ▣ Heaviest **density** of requests is at the other end
  - ▣ The requests have also waited the **longest**
    - Go there first?
    - Circular SCAN (**C-SCAN**)

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS

L30.42

42

43

### LOOK scheduling is a variant of C-SCAN scheduling

- Arm goes only as far as the final request
- Reverse direction
  - Without going all the way to the end

COLORADO STATE UNIVERSITY Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT DISK SCHEDULING ALGORITHMS L30.44

44

45

### Selection of disk scheduling algorithms

- Depends on **number** and **types** of requests
  - ▣ If there is always *just one outstanding request*?
    - All algorithms behave the same way
- Requests for disk service influenced by **file-allocation** method
  - ▣ Location of directories and index blocks

COLORADO STATE UNIVERSITY  
Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS L30.46

46

## OS has other constraints on the order in which these requests are serviced

- **Demand paging** has priority over application I/O
- If **cache is running out of free pages**
  - ▣ Writes are more important than reads
- Order a set of disk writes
  - ▣ To make file system more robust to system crashes

COLORADO STATE UNIVERSITY

Professor: SHRIDEEP PALICKARA  
COMPUTER SCIENCE DEPARTMENT

DISK SCHEDULING ALGORITHMS
