CS545 Machine Learning Course introduction BASED ON YOUR INTERNET HISTORY, YOU MIGHT HE DUMB FROM THE INTERNAVOU MIGHT BE DUMB FROM THE INTERNANET 15MACHINE LEARNING

EXTREME SPORTS.

Machine learning and related fields

Machine learning: the construction and study of systems that learn from data.

Pattern recognition: the same field, different practitioners

Data mining / big data: using ML to discover patterns in (big) data

Statistics and probability: a lot of algorithms have a probabilistic flavor

Example problem: handwritten digit recognition

00011(1112)

22223333

3444475555

447777388

8889999

How is this relevant to machine learning?

Overlooks inquity

Type the two words:

Tasks best solved by a learning algorithm

Recognizing patterns and anomalies:

- Face recognition
- Handwritten or spoken words
- Medical images
- Unusual credit card transactions
- Unusual patterns of sensor readings (in nuclear power plants or car engines)
- Stock prices

Examples of machine learning on the web

Spam filtering, fraud detection:

■ The enemy adapts so we must adapt too.

Recommendation systems (amazon, netflix):

Lots of noisy data. Million dollar prize!

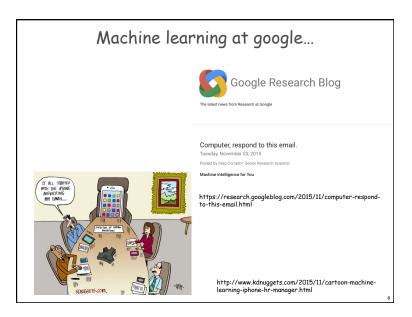

Information retrieval:

Find documents or images that are relevant to a query.

"The machine learning algorithm wants to know if we'd like a dozen wireless mice to feed the Python book we just bought."

http://www.kdnuggets.com/2014/12/cartoon-unexpecteddata-science-recommendations.html

Course Objectives

The machine learning toolbox

- Formulating a problem as an ML problem
- Understanding a variety of ML algorithms
- Running and interpreting ML experiments
- Understanding what makes ML work theory and practice

The Book

Learning from data

http://amlbook.com

The website contains several e-chapters

Grading

Assignments + project are 95% of the grade

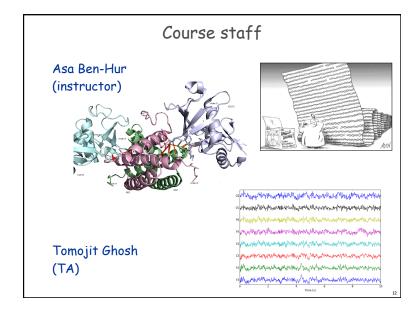

Of that: 5 assignments, worth 80%

Combination of implementation, running ML experiments, and theory questions

A "project" assignment worth 20%

You choose what you want to work on!

The rest: Canvas quizzes

About this course

Course webpage:

http://www.cs.colostate.edu/~cs545

Slides/assignments are posted on the course webpage's schedule page.

Canvas will be used for: forums, grades, quizzes

Piazza will be our primary communication tool

Implementation: Python

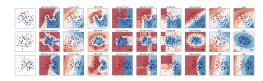

Why Python?

- * A concise and intuitive language
- Simple, easy to learn syntax
- Highly readable, compact code
- Supports object oriented and functional programming
- Strong support for integration with other languages (C,C++,Java)

Implementation: Python

Why Python for ML?

- An interpreted language allows for interactive data analysis
- \star Libraries for plotting and vector/matrix computation
- Cross-platform compatibility
- Free
- Language of choice for many ML researchers (other options: matlab, R); many ML packages available.

Why Python

I am more productive!

 Machine performance vs. programmer performance

Makes programming fun!

image from: ftp://www.mindview.net/pub/eckel/ LovePython.zip

Which version?

2.x or 3.x?

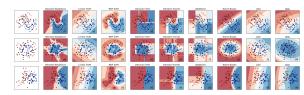

Python 3 is a non-backward compatible version that removes a few "warts" from the language.

We will use Python 3.

17

ML in Python

Concepts and algorithms will be demonstrated using scikit-learn Available at: http://scikit-learn.org/

NumPy: operations on arrays and matrices

Matplotlib: plotting library

18

The Anaconda python distribution

Contains (almost) all the packages that will be used in this course. $\label{eq:contains}$

How will we learn Python?

- Overview of Python/scikit-learn in lecture.
- Course website has links to Python tutorials and other resources

Labeled data

E-mail	feature ₁	feature ₂	Spam?
1	1	1	1
2	1	0	-1
3	0	1	-1
4	0	0	1
5	0	0	-1

 x_1 and x_2 are two characteristics of emails (e.g. the presence of the word "viagara"). These are called features

Spam? Is the label associated with the each email

This is a binary classification problem

21

Binary classification

Scatter plot of labeled data with two features (dimensions)

Another example: Credit approval

Should an applicant be approved for credit?

Feature	Value
Gender	Male
Salary	70,000
Debt	21,000
Years in job	1 year

Key components of a learning problem

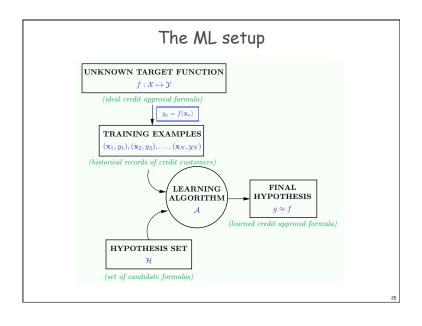

- Salary, debt, years in residence, . . .
- input $\mathbf{x} \in \mathbb{R}^d = \mathcal{X}$.

Approve credit or not

- output $y \in \{-1, +1\} = \mathcal{Y}$.
- \bullet True relationship between ${\bf x}$ and y
- target function $f: \mathcal{X} \mapsto \mathcal{Y}$. (The target f is unknown.)

 \bullet Data on customers

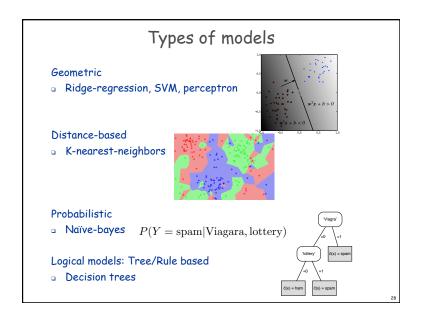

data set $\mathcal{D} = (\mathbf{x}_1, y_1), \dots, (\mathbf{x}_N, y_N).$ $(y_n = f(\mathbf{x}_n).)$

Not every problem is a ML problem

- « Classifying numbers into primes and non-primes.
- Predicting the time it would take a falling object to hit the ground.
- $_{\diamond}$ Determining the optimal cycle for traffic lights in a busy intersection.
- Medical diagnosis

Types of learning tasks

Supervised learning

• Learn to predict output given labeled examples

Unsupervised learning

- Data is unlabeled
- Create an internal representation of the input e.g. form clusters; extract features
- Most "big" datasets do not come with labels

Reinforcement learning

Maximizing "reward" (not covered).

ML in Practice

- Understanding the domain, and goals
- * Creating features, data cleaning and preprocessing
- Learning models
- * Interpreting results
- * Consolidating and deploying discovered knowledge

An iterative process

Human vs machine learning

Human	Machine
Observe someone, then repeat	Supervised Learning
Keep trying until it works (riding a bike)	Reinforcement Learning
Memorize	k-Nearest Neighbors
20 Questions	Decision Tree
A network of neurons with complex interconnections	Neural networks

Training vs testing

hypothesis target function

Out-of-sample error: (testing error)

 $E_{\text{out}}(h) = \mathbb{P}_{\mathbf{x}} [h(\mathbf{x}) \neq f(\mathbf{x})]$

In-sample error: (training error)

 $E_{\rm in} = \frac{1}{N} \sum_{i=1}^{N} \mathbb{1}[h(\mathbf{x}_i) \neq f(\mathbf{x}_i)]$

Indicator function

Training: finding a rule that minimizes E_{in} Testing: getting an estimate of E_{out}

Training vs testing

The aim of supervised learning is to do well on test data that is not known during training.

We want the learning machine to model the true regularities in the data and to ignore the noise.

 But the learning machine does not know which regularities are real and which are accidental quirks of the particular set of training examples we happen to have.

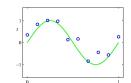

So how can we be sure that the machine will generalize well to new data?

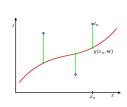

A simple example: Fitting a polynomial

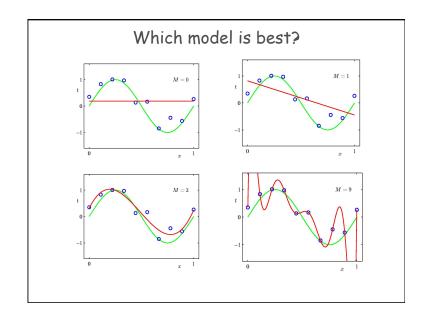

The green curve is the true function (which is not a polynomial)

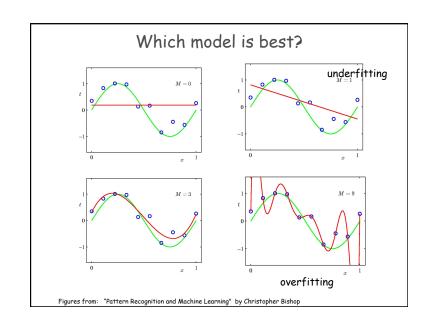

The data points have noise in y.

Measure of error (a.k.a. loss function) that measures the deviation of the prediction y(x) from the true value – summed over all the examples.

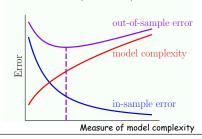

Trading off goodness of fit against model complexity

You can only expect a model to generalize well if it explains the data surprisingly well given the complexity of the model.

If the model has as many degrees of freedom as the data, it can fit the data perfectly. But so what?

What we'll cover

Supervised learning

- Linear classifiers
- Support vector machines
- Neural networks and deep learning
- Nearest neighbor classifiers
- Probabilistic classifiers
- Briefly mentioned: decision trees and ensemble models

Unsupervised learning

- Clustering
- Dimensionality reduction

Running and interpreting ML experiments
