

CS 370: OPERATING SYSTEMS
[MEMORY MANAGEMENT]

Shrideep Pallickara
Computer Science
Colorado State University

October 30, 2018 CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University L21.1

Frequently asked questions from the previous class survey

- Compaction
 - What if there is no space for a process after compaction?
- Are segments placed in logical or physical memory?
- Is it common to have 32-bit addresses vs 64-bit?

October 30, 2018 CS370: Operating Systems [Fall 2018]
Professor: SHRIDEEP PALICKARA Dept. Of Computer Science, Colorado State University L21.2

Topics covered in this lecture

- Paging
- Translation look-aside buffers (TLB)
- Memory Protection in paged environments
- Shared Pages
- Page sizes

October 30, 2018 CS370: Operating Systems [Fall 2018]
Professor: SHRIDEEP PALICKARA Dept. Of Computer Science, Colorado State University L21.3

The Paging memory management scheme

- Physical address space of process can be **non-contiguous**
- Solves problem of fitting variable-sized memory chunks to backing store
 - Backing store has fragmentation problem
 - Compaction is impossible

October 30, 2018 CS370: Operating Systems [Fall 2018]
Professor: SHRIDEEP PALICKARA Dept. Of Computer Science, Colorado State University L21.4

Basic method for implementing paging

- Break memory into **fixed-sized** blocks
 - Physical memory: **frames**
 - Logical memory: **pages**

} Same size
- Backing store is also divided the same way

October 30, 2018 CS370: Operating Systems [Fall 2018]
Professor: SHRIDEEP PALICKARA Dept. Of Computer Science, Colorado State University L21.5

What will seem odd, and perhaps cool, about paging [1/2]

- While a program **thinks of its memory as linear ...**
 - It is usually **scattered** throughout physical memory in a kind of abstract mosaic
- The processor will execute one instruction after another using virtual addresses
 - The virtual addresses are still linear
 - However, an instruction located at the end of a page will be located in a **completely different region** of physical memory from the next instruction at start of another page

October 30, 2018 CS370: Operating Systems [Fall 2018]
Professor: SHRIDEEP PALICKARA Dept. Of Computer Science, Colorado State University L21.6

What will seem odd, and perhaps cool, about paging [2/2]

- Data structures appear to be contiguous using virtual addresses
 - But a large matrix is scattered across many physical page frames

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.7

Paging: Analogy

- Shuffling several decks of cards together
- A single process in its virtual address page sees the cards of a single deck in order
 - A different process sees a completely different deck, but it will also be in order
- In physical memory, however, the **decks of all processes** currently running will be **shuffled** together, apparently at random
- Page tables are the magician's assistant in locating cards from the shuffled decks

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.8

Paging: Logical and Physical Memory

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.9

Paging Hardware: Performing address translation

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.10

Page size

- A **power of 2**
 - Typical sizes: 512 bytes – 16 MB
- Size of logical address: 2^m
- Page size: 2^n

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.11

Paging and Fragmentation

- No external fragmentation**
 - Free frame available for allocation to other processes
- Internal fragmentation possible**
 - Last frame may not be full
 - If process size is independent of page size
 - Internal fragmentation = $\frac{1}{2}$ page per process

October 30, 2018
 Professor: SHRIDEEP PALICKARA
 CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University
 L21.12

Page sizes

- Processes, data sets, and memory have all grown over time
 - Page sizes have also increased
- Some CPUs/kernels support multiple page sizes

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.13

Paging: User program views memory as a single space

- Program is **scattered** throughout physical memory
- User view and physical memory **reconciled** by
 - Address-translation hardware
- Process has no way of addressing memory outside of its page table

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.14

OS manages the physical memory

- Maintains **frame-table**; one entry per frame
 - Free or allocated?
 - If allocated: Which page of which process
- Maintains a page table for **each process**
 - Used by CPU dispatcher to define hardware page table when process is CPU-bound
 - Paging increases context switching time

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.15

Example: 32-bit address space

- Page size = 4K
- Logical address = 0x23FA427
- What's the offset within the page?
 - 0x427
- What's the page number?
 - 0x23FA
- Page table entry maps 0x23FA to frame 0x12345 what is the physical memory address for the logical address?
 - 0x12345427

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.16

Example: 32-bit address space

- Page size = 1K
- Logical address = 0x23FA427
- What's the offset within the page?
 - 000010011
- What's the page number?
 - 0000 0010 0011 1111 1010 01

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.17

All accesses to memory must go through a map.
Efficiency is important.

HARDWARE SUPPORT FOR PAGING

October 30, 2018

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L20.18

The purpose of the page table is to map virtual pages onto physical frames

- Think of the page table as a **function**
 - ▣ Takes virtual page number as an argument
 - ▣ Produces physical frame number as result
- Virtual page field in virtual address replaced by frame field
 - ▣ Physical memory address

October 30, 2018
Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.19

Two major issues facing page tables

- Can be **extremely large**
 - ▣ With a 4 KB page size, a 32-bit address space has 1 million pages
 - ▣ Also, each process has its own page table
- The **mapping must be fast**
 - ▣ Virtual-to-physical mapping must be done on *every memory reference*
 - ▣ Page table lookup should not be a bottleneck

October 30, 2018
Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.20

Implementing the page table: Dedicated registers

- When a process is assigned the CPU, the dispatcher reloads these registers
- Feasible if the page table is **small**
 - ▣ However, for most contemporary systems entries are greater than 10^6

October 30, 2018
Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.21

Implementing the page table in memory

- Page table base register (PTBR) points to page table
- 2 memory accesses for each access
 - ▣ One for the page-table entry
 - ▣ One for the byte

October 30, 2018
Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.22

Process and its page table: When is the page table entirely in memory?

- A **pointer** to the page table is stored in the *page table base register (PTBR)* in the PCB
 - ▣ Similar to the program counter
- Often there is also a register which tracks the number of entries in the page table
- Page table need not be memory resident when the process is swapped out
 - ▣ *But must be in memory when process is running*

October 30, 2018
Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.23

Cash is king. — Pehr Gyllenhammar

TRANSLATION LOOK-ASIDE BUFFERS

October 30, 2018

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.24

Observation

- Most programs make a *large number of references to a small number of pages*
 - Not the other way around
- Only a small fraction of the page table entries are heavily read
 - Others are barely used at all

October 30, 2018
 Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.25

Translation look-aside buffer (TLB): Small, fast-lookup hardware cache

- Number of TLB entries is small (64 ~ 1024)
 - Contains few page-table entries
- Each entry of the TLB consists of 2 parts
 - A key and a value
- When the associative memory is presented with an item
 - Item is compared with all keys *simultaneously*

October 30, 2018
 Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.26

Using the TLB with page tables [1/2]

- TLB contains only a *few* page table entries
- When a logical address is generated by the CPU, the page number is presented to the TLB
 - When frame number is found (TLB hit), use it to access memory
 - Usually just 10-20% longer than an unmapped memory reference

October 30, 2018
 Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.27

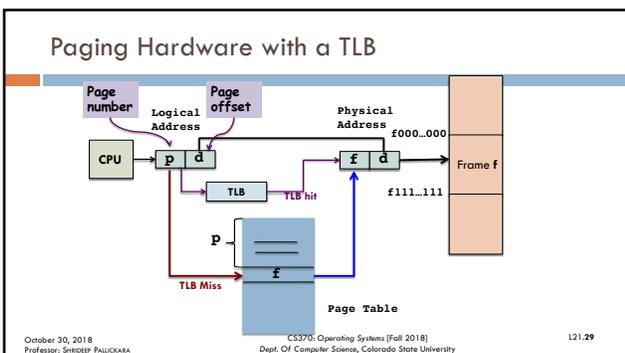

Using the TLB with page tables [2/2]

- What if there is a **TLB miss**?
 - Memory reference to page table is made
 - Replacement policies for the TLB entries
- Some TLBs allow certain entries to be **wired down**
 - TLB entries for kernel code are wired down

October 30, 2018
 Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.28

TLB and Address Space Identifiers (ASIDs)

- ASID uniquely **identifies** each process
 - Allows TLB to contain addresses from several different processes simultaneously
- When resolving page numbers
 - TLB ensures that ASIDs match
 - If not, it is treated as a **TLB miss**

October 30, 2018
 Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.30

Without ASIDs TLB must be flushed with every context switch

- Each process has its own page table
- Without flushing or ASIDs, TLB could include old entries
 - Valid virtual addresses
 - But *incorrect or invalid* physical addresses 
 - From **previous** process

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.31

Effective memory access times

- 20 ns to search TLB
- 100 ns to access memory
- If page is in TLB: access time = 20 + 100 = 120 ns
- If page is not in TLB:
 $20 + 100 + 100 = 220$ ns

Access TLB → **Access memory to retrieve frame number**

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.32

Effective access times with different hit ratios

- 80%
 $= 0.80 \times 120 + 0.20 \times 220 = 140$ ns
- 98%
 $= 0.98 \times 120 + 0.02 \times 220 = 122$ ns
- When hit rate increases from 80% to 98%
 - Results in ~13% reduction in access time

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.33

TLB in practical settings

- Hit time: 0.5 – 1 clock cycle
- Miss penalty: 10 – 100 clock cycles
- Miss rate: 0.01 - 1%

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.34

MEMORY PROTECTION IN PAGED ENVIRONMENTS

October 30, 2018

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.35

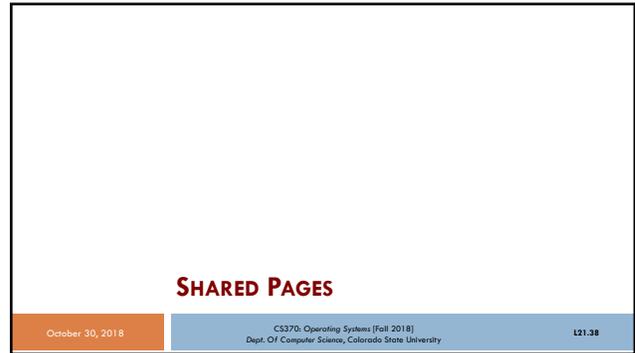

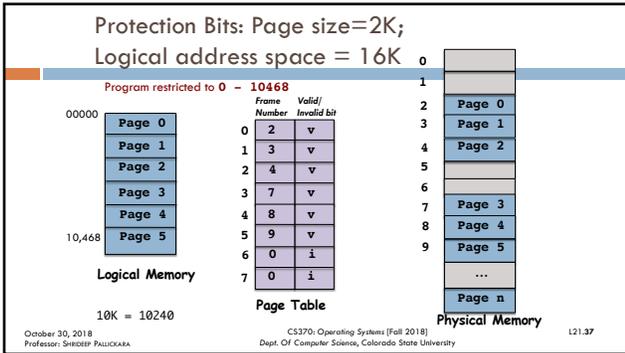

Protection bits are associated with each frame

- Kept in the page table
- Bits can indicate
 - Read-write, read-only, execute
 - Illegal accesses can be trapped by the OS
- Valid-invalid bit
 - Indicates if page is in the process's logical address space

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.36

Reentrant Code [1/2]

- A computer program or subroutine is called **reentrant** if:
 - It can be *interrupted* in the middle of its execution and
 - Then safely called again ("re-entered") *before* its previous invocations complete execution

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.39

Reentrant Code [2/2]

- **Non-self-modifying**
 - Does not change during execution
- Two or more processes can:
 - ① Execute same code at same time
 - ② Will have different data
- Each process has:
 - Copy of registers and data storage to hold the data

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.40

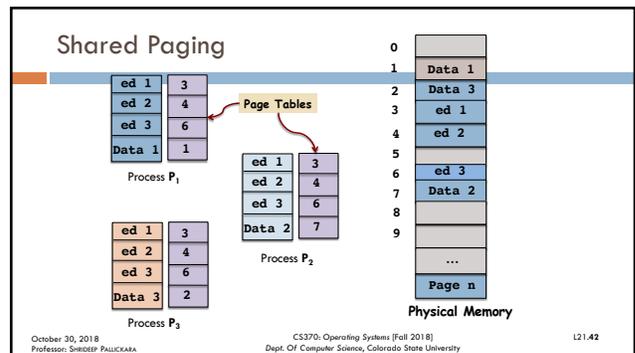

Shared Pages

- System with N users
 - Each user runs a text editing program
- Text editing program
 - 150 KB of code
 - 50 KB of data space
- 40 users
 - Without sharing: 8000 KB space needed
 - With sharing : $150 + 40 \times 50 = 2150$ KB needed

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.41

Shared Paging

- Other heavily used programs can be shared
 - ▣ Compilers, runtime libraries, database systems, etc.
- To be shareable:
 - ① Code must be *reentrant*
 - ② The OS *must enforce read-only* nature of the shared code

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.43

PAGE SIZES

October 30, 2018

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.44

Paging and page sizes

- On average, $\frac{1}{2}$ of the final page is empty
 - ▣ Internal fragmentation: wasted space
- With n processes in memory, and a page size p
 - ▣ Total $np/2$ bytes of internal fragmentation
- **Greater page size = Greater fragmentation**

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.45

But having small pages is not necessarily efficient

- Small pages mean programs need more pages
 - ▣ **Larger** page tables
 - ▣ 32KB program needs
 - 4 8KB pages, but 64 512-byte pages
- **Context switches** can be *more expensive* with small pages
 - ▣ Need to reload the page table

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.46

Transfers to-and-from disk are a page at a time

- Primary Overheads: Seek and rotational delays
- Transferring a small page almost as expensive as transferring a big page
 - $64 \times 15 = 960$ msec to load 64 512-bytes pages
 - $4 \times 25 = 100$ msec to load 4 8KB pages
- Here, **large** pages make sense

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.47

Overheads in paging: Page table and internal fragmentation

- Average process size = s
- Page size = p
- Size of each page entry = e
- Pages per process = s/p
 - se/p : Total page table space
- Total Overhead = $se/p + p/2$
 - ▣ **Page table overhead** (points to se/p)
 - ▣ **Internal fragmentation loss** (points to $p/2$)

October 30, 2018
 Professor: SHRIDEEP PALLICKARA

CS370: Operating Systems [Fall 2018]
 Dept. Of Computer Science, Colorado State University

L21.48

Looking at the overhead a little closer

- Total Overhead = $se/p + p/2$
 - Increases if p is small
 - Increases if p is large
- Optimum is somewhere *in between*
- First derivative with respect to p
$$-se/p^2 + 1/2 = 0 \quad \text{i.e. } p^2 = 2se$$
$$p = \sqrt{2se}$$

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.49

Optimal page size: Considering only page size and internal fragmentation

- $p = \sqrt{2se}$
- $s = 128\text{KB}$ and $e=8$ bytes per entry
- Optimal page size = 1448 bytes
 - In practice we will never use 1448 bytes
 - Instead, either 1K or 2K would be used
 - Why? Pages sizes are in powers of 2 i.e. 2^X
 - Deriving offsets and page numbers is also easier

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.50

Pages sizes and size of physical memory

- As physical memories get bigger, page sizes get larger as well
 - Though *not linearly*
- Quadrupling physical memory size rarely even doubles page size

October 30, 2018
Professor: SHRIDEEP PALICKARA

CS370: Operating Systems [Fall 2018]
Dept. Of Computer Science, Colorado State University

L21.51
